

Lab 6 – Lambda Shared Responsibility

Task 1 – Create a Lambda Function

Lambda Function name

- ***myFirstLambdaFuction***

Create function [Info](#)
Choose one of the following options to create your function.

☒ **Author from scratch**
Start with a simple Hello World example.

☐ **Use a blueprint**
Build a Lambda application from sample code and configuration presets for common use cases.

☐ **Container image**
Select a container image to deploy for your function.

Basic information

Function name
Enter a name that describes the purpose of your function.

Function name must be 1 to 64 characters, must be unique to the Region, and can't include spaces. Valid characters are a-z, A-Z, 0-9, hyphens (-), and underscores (_).

Runtime [Info](#)
Choose the language to use to write your function. Note that the console code editor supports only Node.js, Python, and Ruby.

Permissions
By default, Lambda will create an execution role with permissions to upload logs to Amazon CloudWatch Logs. To use a different role, choose **Custom execution role** under **Additional settings**.

Custom settings [Info](#)

☒ **Durable execution**
Build resilient, stateful applications with automatic failure recovery.

☒ **EC2 capacity provider**
Run Lambda on your preferred EC2 instance types instead of Lambda's serverless compute (default).

Additional settings
Customize your function architecture, execution role, HTTP(S) endpoints, tenant isolation mode, VPC, code signing, KMS key, and tags.

Settings marked with this icon cannot be added or removed after the function is created. All other settings can be changed later.

[Cancel](#) [Create function](#)

Task 3 – Deploy a simple World Function.

Choose a tutorial

Learn how to implement common use cases in AWS Lambda.

Create a simple web app

In this tutorial you will learn how to:

- Build a simple web app, consisting of a Lambda function with a function URL that outputs a webpage
- Invoke your function through its function URL
