

Lab5 – RDS Responsibility

Task 1

Create a MySQL

The screenshot shows the AWS Management Console interface for an Amazon RDS database instance. The left sidebar contains navigation links for Aurora and RDS, Databases, Performance Insights, Snapshots, Export to Amazon S3, Automated backups, Reserved instances, Proxies, Subnet groups, Parameter groups, Option groups, Custom engine versions, Zero-ETL integrations, Events, Event subscriptions, Recommendations, and Certificate updates. The main content area displays the details for 'database-1-instance-1'. The 'Related' section shows a table with columns for DB identifier, Status, Role, Engine, Region, Size, Recommendations, CPU, Current, Maintenance, VPC, and Multi-AZ. The instance is in an 'Available' state. The 'Connectivity & security' tab is active, showing options for connecting using Code snippets, CloudShell, or Endpoints. It also displays the IAM authentication status as 'Enabled' and the programming language as 'MySQL (macOS)'. Connection steps are provided for both export and psql commands.

The screenshot shows the 'Service overview' and 'Service health' sections of the AWS Management Console. The 'Service overview' section displays metrics for DB clusters (1), DB instances (1), Snapshots (1), and Recent events (11). The 'Service health' section shows the current status as 'Amazon Relational Database Service (N. Virginia)' and indicates that the service is operating normally. The 'Recommended services' section shows no recommendations yet. The 'Explore RDS' section provides a tutorial link. The 'RDS costs' section shows the date range as 'Past 6 months', the region as 'Global', and the credits remaining as '\$139.62 USD' with 167 days remaining.

Snapshot

The screenshot shows the 'Manual snapshots' section of the AWS Management Console. It displays a table with columns for Snapshot name, Engine version, DB instance or cluster, Snapshot creation time, DB instance created time, Status, Progress, VPC, Snapshot type, and Storage. The table shows a single snapshot named 'database-1-final-snapshot' created on July 24, 2026, at 23:17 UTC+02:00, with a status of 'Available' and a storage size of '<1 GB'.

Events

The screenshot shows the 'Events' section of the AWS Management Console. It displays a table with columns for Source, Type, Time, and Message. The table shows a series of events related to the database instance, including cluster deletion, snapshot creation, instance deletion, manual cluster snapshot creation, parameter adjustment, instance shutdown, instance resumption, topology update, instance pause, and cluster creation.

Delete Snapshot

database-1-final-snapshot

Actions

- Restore snapshot
- Copy snapshot
- Share snapshot
- Migrate snapshot
- Export to Amazon S3
- Delete snapshot
